

Rescue

RENEWABLE SMART COOLING FOR URBAN EUROPE

RESCUE Impact Calculator

Stratego Workshop Edinburgh, 2014-11-17

Elisabeth Eckstädt, TU Dresden (D)

Rationales for the tool

- provide rough estimations based on few input numbers, so that it can be used with small previous knowledge
- Compare District Cooling to a distributed solution in terms of
 - Costs
 - Environmental measures

Basics were developed in the project and are documented in the reports on the website

Potential

- **Market potential**
- **Sources**
- **Environmental savings**

How to get access:

Pre-final version available

→ Quick Start Guide and manual

→ Feedback appreciated

Providing basic Information

Selection tree offering options

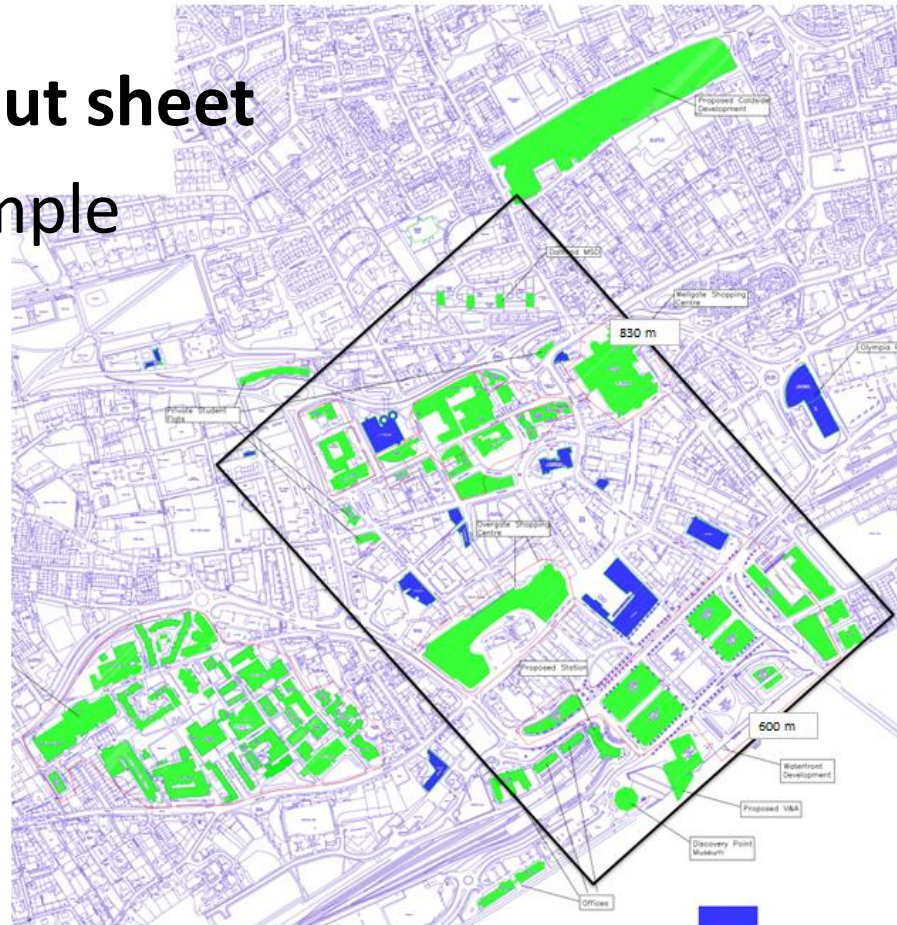

INPUT

1. Framework for energy factors and prices			
Country	United Kingdom		
price level in country	high		
2. Demand			
Demand known?	No		
City	not in list		
ECI known?	Yes		
ECI given	30		
Area	350000	m2	coloured buildings
number of ETS	15		
pipe length	1100	m	
3. What type of demands has the area? In case there is more than one please provide de percentage of area			
Residential	0	%	100%
Service Sector	39	%	
Industrial Sector	1	%	
uncooled	60	%	
specific cooling dmd. industrial areas	78	kWh/m2/a	
4. Base Case: What type of cooling system are install? In case there is more than one please provide de			
Room Air Conditioner & Central Air Conditioner	0	%	100%
Air-Cooled Chiller	0	%	
Water-Cooled Chiller	100	%	
Absorption Chiller	0	%	
5. Is cold water (4...16°C) available?			
River, Sea, Aquifer	Yes		
6. Which heat sources should be considered?		7. Give the share of heat sources in the mixed source heating network	
fossil fired boilers	Yes	10%	
Solar Thermal	No	0%	
Geothermal	No	5%	
CHP	No	80%	
Heat Waste	No	5%	
DH mixed sources	Yes	100%	

The input sheet kept simple

MAP

Providing basic Information

1. Framework for energy factors and prices	
Country	United Kingdom
price level in country	high

Price level of the country

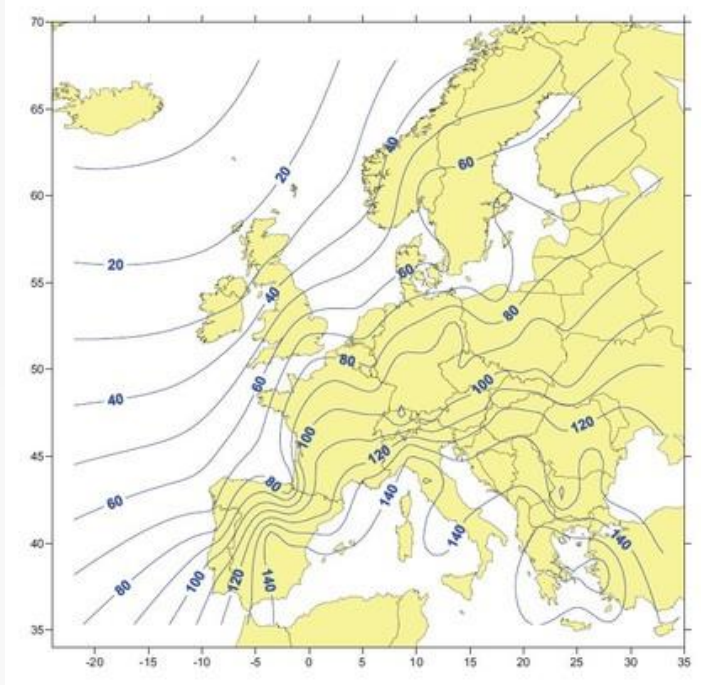

Energy factors: e.g. how many emissions are connected to 1 kWh of electricity

Cooling demand calculation

3 options:

1. Demand is known
2. demand is calculated with the ECI of this city
3. annual average temperature should be given

1

2. Demand		
Demand known?	Yes	
demand given	0	kWh/a

2

2. Demand		
Demand known?	No	
City	not in list	
ECI known?	Yes	
ECI given	30	

3

2. Demand		
Demand known?	No	
City	not in list	
ECI known?	No	
Temperature	10	°C

- Area

Area	350000	m ²
------	--------	----------------

- Type of area (Comfort cooling, process cooling)

3. What type of demands has the area? In case there is more than one please provide de percentage of area

Residential	0	%
Service Sector	40	%
Industrial Sector	0	%
uncooled	60	%

- Important for investment costs and pumping energy

number of ETS	15	
pipe length	1100	m

Cooling demand calculation

Definition of a base case:

- Usually this will be a room Air Conditioner with Central Air supply, which has a EER of 1.5...3
- other devices are bit more efficient, exact values can be found in the manual
- Values of EER can also be adopted if you as an expert are aware of these numbers

4. Base Case: What type of cooling system are install?
 In case there is more than one please provide de

Room Air Conditioner & Central Air Conditioner	0	%
Air-Cooled Chiller	0	%
Water-Cooled Chiller	100	%
Absorption Chiller	0	%

Cooling demand calculation

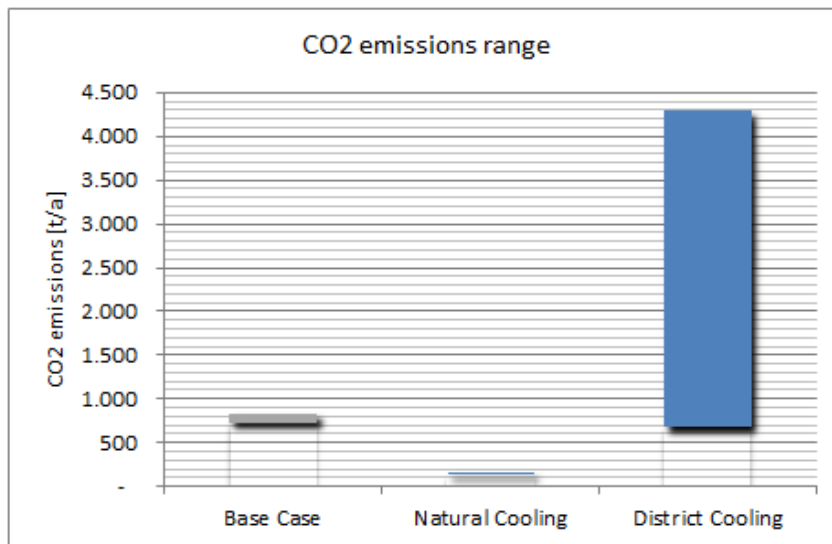

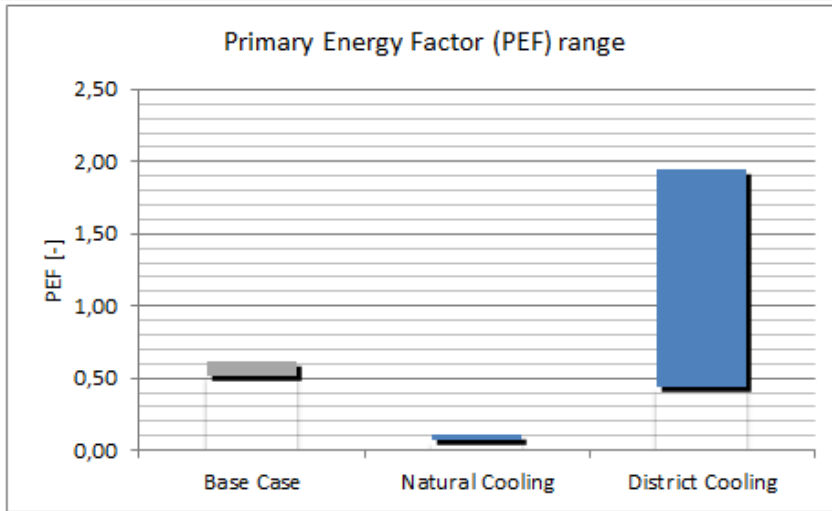

Definition of sources /heat sinks:

- cold water, that is suitable for natural cooling (approx 4...16°C)
- heat sources (fossil fired boilers and electricity are postulated to be always available)
- District Heating Network incl. share of the heat sources

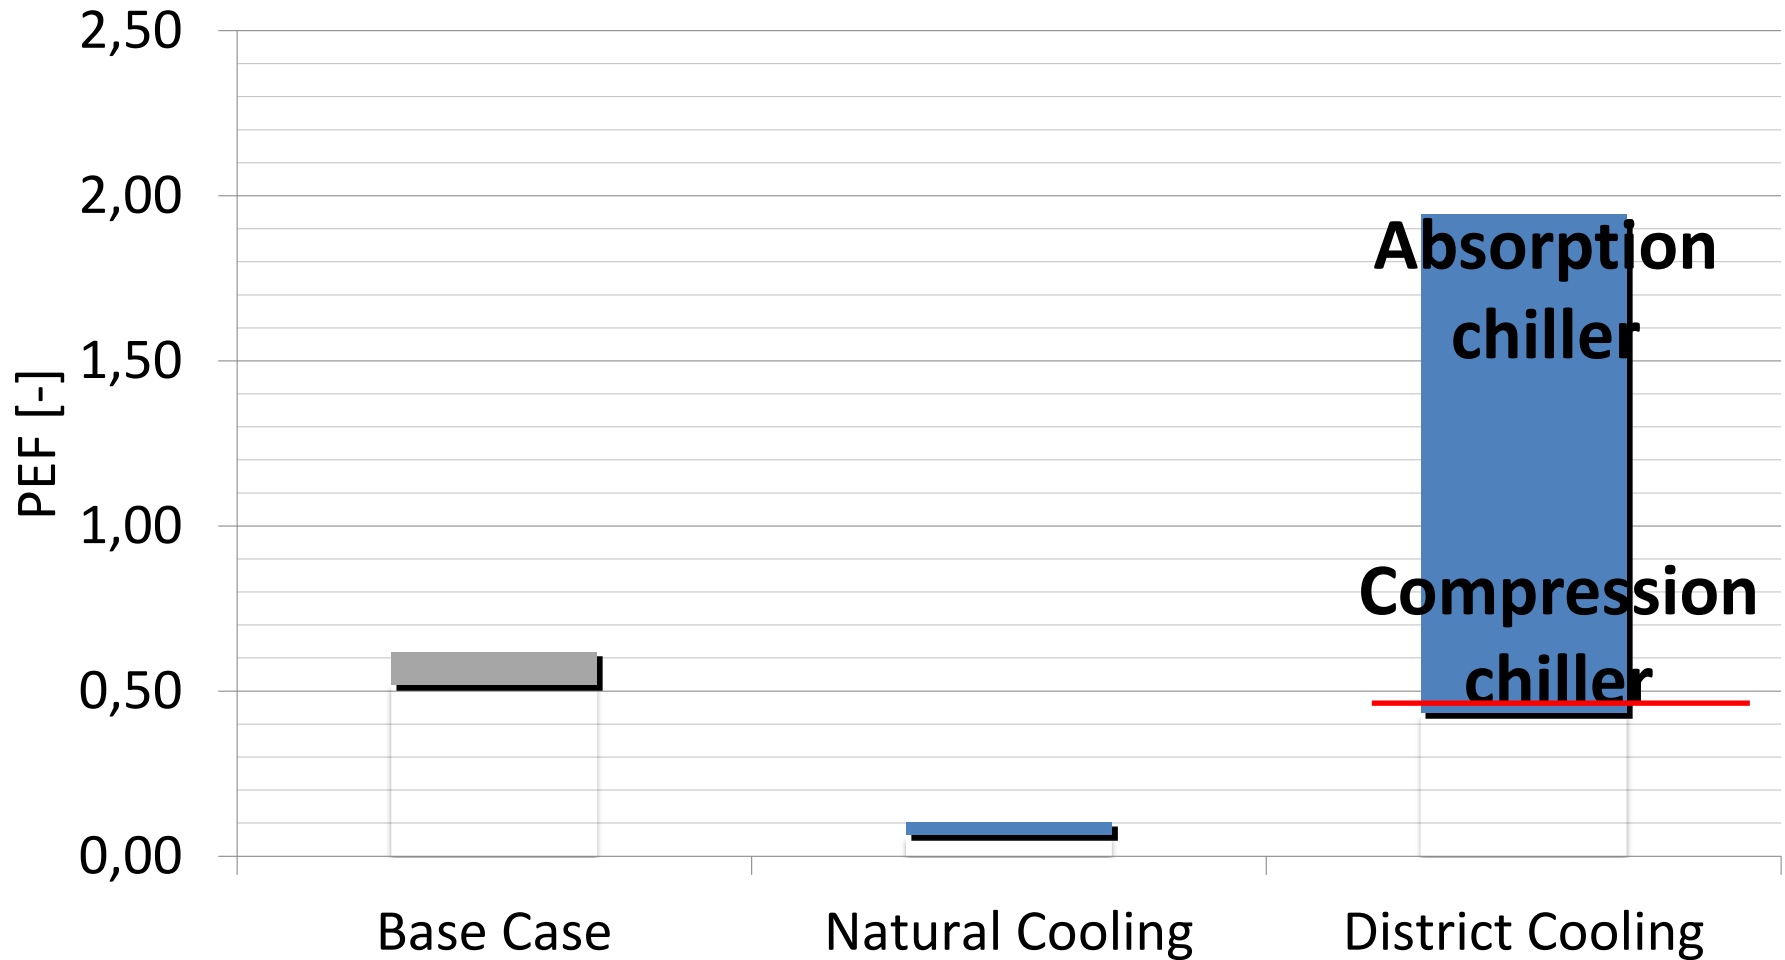

5. Is cold water (4...16°C) available?	
River, Sea, Aquifer	Yes

6. Which heat sources should be considered?	
fossil fired boilers	Yes
Solar Thermal	No
Geothermal	No
CHP	No
Heat Waste	No
DH mixed sources	No

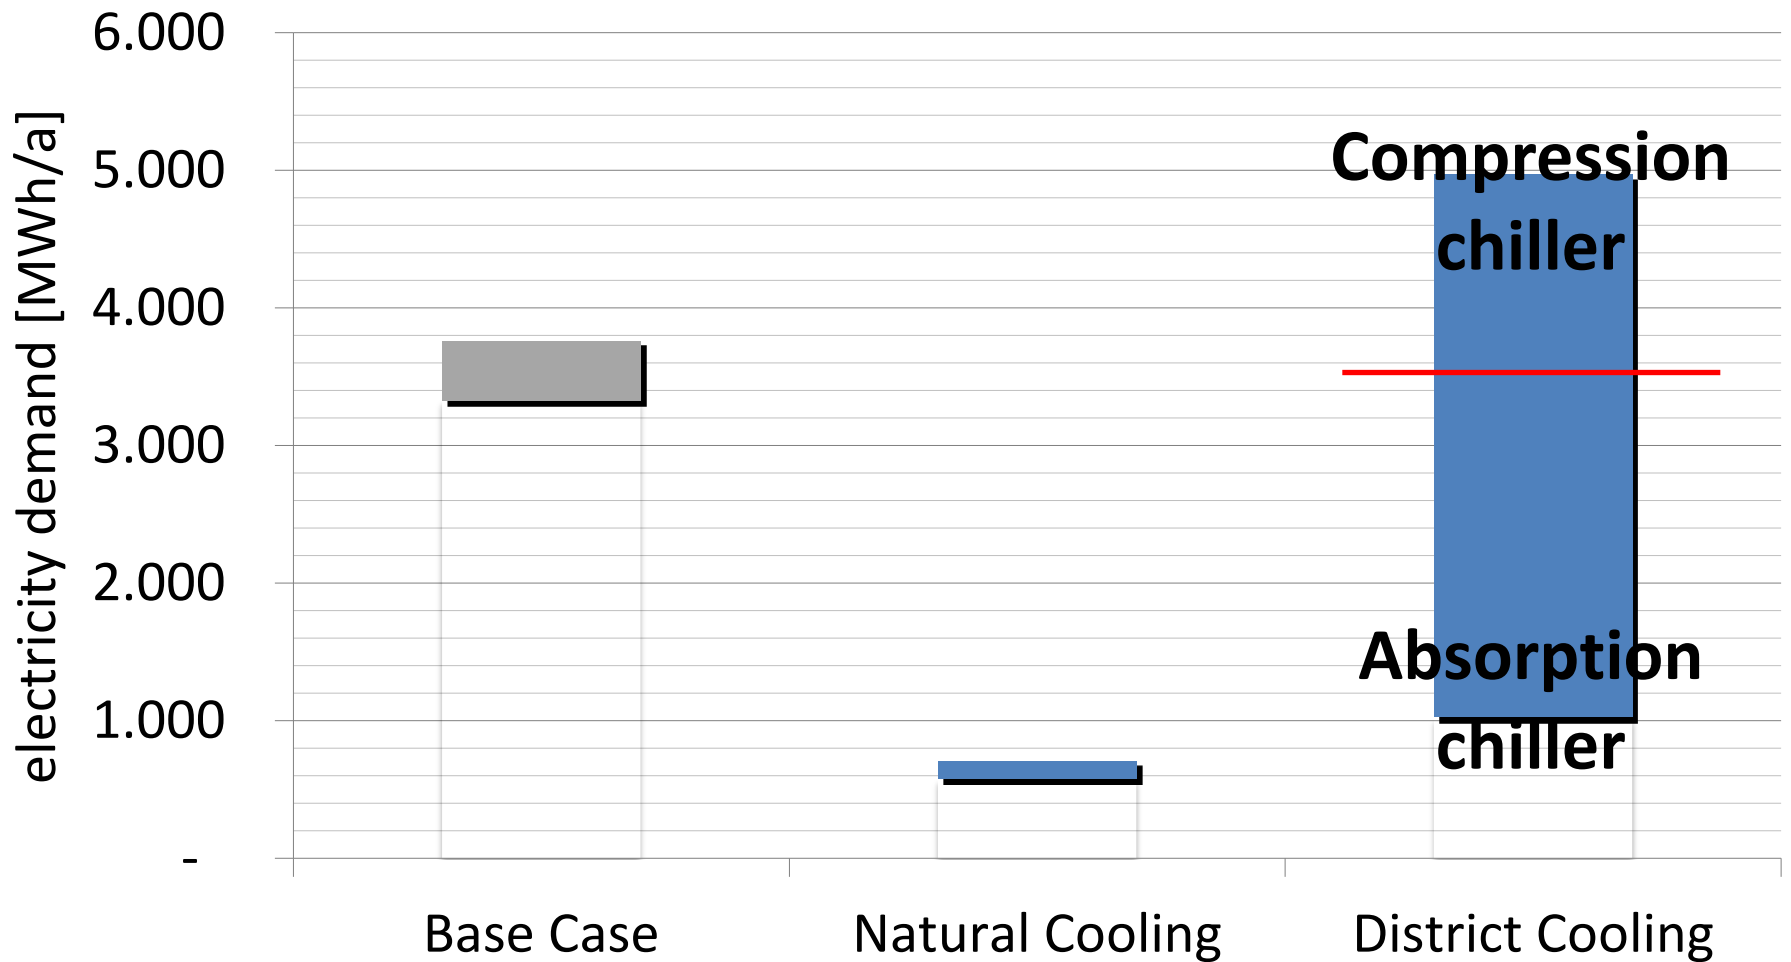

Example – Dundee - Output

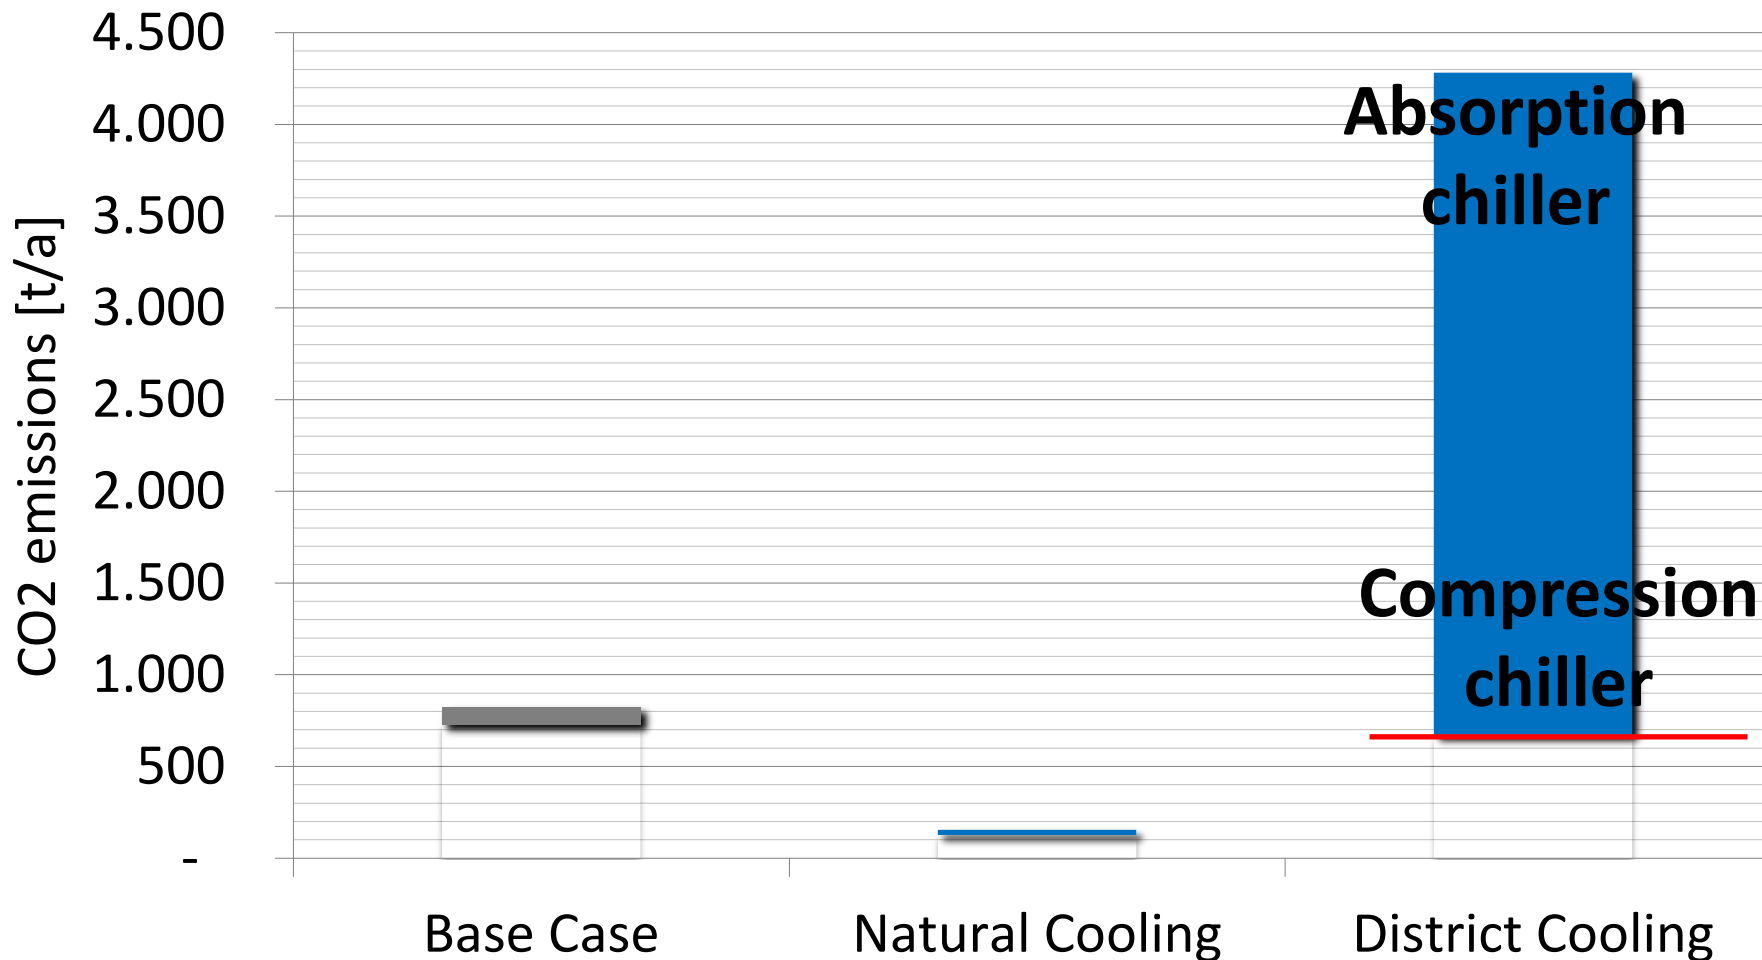

Primary Energy Factor (PEF) range

electricity demand range

CO2 emissions range

costs (including investment)
